NPWS (2019) Conservation Objectives: Fin Lough (Offaly) SAC 000576. Version 1. National Parks and Wildlife Service, Department of Culture, Heritage and the Gaeltacht.

> Series Editor: Rebecca Jeffrey ISSN 2009-4086

Introduction

The overall aim of the Habitats Directive is to maintain or restore the favourable conservation status of habitats and species of community interest. These habitats and species are listed in the Habitats and Birds Directives and Special Areas of Conservation and Special Protection Areas are designated to afford protection to the most vulnerable of them. These two designations are collectively known as the Natura 2000 network.

European and national legislation places a collective obligation on Ireland and its citizens to maintain habitats and species in the Natura 2000 network at favourable conservation condition. The Government and its agencies are responsible for the implementation and enforcement of regulations that will ensure the ecological integrity of these sites.

A site-specific conservation objective aims to define favourable conservation condition for a particular habitat or species at that site.

The maintenance of habitats and species within Natura 2000 sites at favourable conservation condition will contribute to the overall maintenance of favourable conservation status of those habitats and species at a national level.

Favourable conservation status of a habitat is achieved when:

- its natural range, and area it covers within that range, are stable or increasing, and
- the specific structure and functions which are necessary for its long-term maintenance
- exist and are likely to continue to exist for the foreseeable future, and
- the conservation status of its typical species is favourable.

The favourable conservation status of a species is achieved when:

• population dynamics data on the species concerned indicate that it is maintaining itself on a long-term basis as a viable component of its natural habitats, and

• the natural range of the species is neither being reduced nor is likely to be reduced for the foreseeable future, and

• there is, and will probably continue to be, a sufficiently large habitat to maintain its populations on a long-term basis.

Notes/Guidelines:

1. The targets given in these conservation objectives are based on best available information at the time of writing. As more information becomes available, targets for attributes may change. These will be updated periodically, as necessary.

2. An appropriate assessment based on these conservation objectives will remain valid even if the targets are subsequently updated, providing they were the most recent objectives available when the assessment was carried out. It is essential that the date and version are included when objectives are cited.

3. Assessments cannot consider an attribute in isolation from the others listed for that habitat or species, or for other habitats and species listed for that site. A plan or project with an apparently small impact on one attribute may have a significant impact on another.

4. Please note that the maps included in this document do not necessarily show the entire extent of the habitats and species for which the site is listed. This should be borne in mind when appropriate assessments are being carried out.

5. When using these objectives, it is essential that the relevant backing/supporting documents are consulted, particularly where instructed in the targets or notes for a particular attribute.

Conservation Objectives for : Fin Lough (Offaly) SAC [000576]

7230 Alkaline fens

To maintain the favourable conservation condition of Alkaline fens in Fin Lough (Offaly) SAC, which is defined by the following list of attributes and targets:

Attribute	Measure	Target	Notes
Habitat area	Hectares	Area stable or increasing, subject to natural processes	Alkaline fen has not been mapped in detail for Fin Lough (Offaly) SAC and thus the current total area of the qualifying habitat in the SAC is unknown. However, it is documented that alkaline fen covers a fairly extensive area, predominantly in the southern and south-eastern parts of the SAC, where the habitat forms a transition between reedbeds and raised bog communities. The habitat is also found in the area to the north of the SAC and also occurs in association with mineral flushes and springs in the north-eastern corner of the SAC (NPWS, 2005; NPWS internal files; see also Farrell, 1972; Tubridy, 1984; Kelly and Power, 1987 in Tubridy and Jeffrey, 1987)
Habitat distribution	Occurrence	No decline, subject to natural processes	See the notes for Habitat area above
Ecosystem function: soil nutrients	Soil pH and appropriate nutrient levels at a representative number of monitoring stops	Maintain soil pH and nutrient status within natural ranges	Relevant nutrients and their natural ranges are yet to be defined. However, nitrogen deposition is noted as being relevant to this habitat in NPWS (2013). See also Bobbink and Hettelingh (2011)
Ecosystem function: peat formation	Percentage cover of peat-forming vegetation and water table levels	Maintain active peat formation, where appropriate	In order for peat to form, water levels need to be slightly below or above the soil surface for c.90% of the time
Ecosystem function: hydrology - groundwater levels	Water levels (centimetres); duration of levels; hydraulic gradients	Maintain, or where necessary restore, appropriate natural hydrological regimes necessary to support the natural structure and functioning of the habitat	Fen habitats require high groundwater levels (i.e. water levels at or above the ground surface) for a large proportion of the calendar year (i.e. duration of mean groundwater level). Fen groundwater levels are controlled by regional groundwater levels in the contributing catchment area (which sustain the hydraulic gradients of the fen groundwater table). Regional abstraction of groundwater may affect fen groundwater levels
Ecosystem function: hydrology - surface water flow	Drain density and form	Maintain, or where necessary restore, as close as possible to natural or semi-natural drainage conditions	Drainage, either within or surrounding the fen habitat, can result in the drawdown of the alkaline fen groundwater table. The depth, geometry and density of drainage (hydromorphology) will indicate the scale and impact on fen hydrology. Drainage can result in loss of characteristic species and transition to drier habitats
Ecosystem function: water quality	Water chemistry measures	Maintain appropriate water quality, particularly pH and nutrient levels, to support the natural structure and functioning of the habitat	Fens receive natural levels of nutrients (e.g. iron, magnesium and calcium) from water sources. However, they are generally poor in nitrogen and phosphorus, with the latter tending to be the limiting nutrient under natural conditions. Water supply should also be relatively calcium-rich
Community diversity	Abundance of variety of vegetation communities	Maintain variety of vegetation communities, subject to natural processes	The entire diversity of alkaline fen vegetation communities present in the SAC is currently unknown. Information on the vegetation communities associated with alkaline fens in the uplands is presented in Perrin et al. (2014)
Vegetation composition: brown mosses	Percentage cover at a representative number of 2m x 2m monitoring stops	Maintain adequate cover of typical brown moss species	Typical brown moss species include <i>Bryum</i> <i>pseudotriquetrum, Calliergonella cuspidata,</i> <i>Calliergon giganteum, Campylium stellatum,</i> <i>Cratoneuron filicinum, Ctenidium molluscum,</i> <i>Fissidens adianthoides, Palustriella commutata,</i> <i>Scorpidium cossonii, S. revolvens</i> and <i>S.</i> <i>scorpioides.</i> In the alkaline fen in the south of the SAC, brown mosses are abundant, with <i>Campylium</i> <i>stellatum</i> being the most dominant. <i>Scorpidium</i> <i>revolvens</i> and a range of calcicolous mosses occur in the habitat in the north-east of the SAC (NPWS, 2005)

Version 1

Page 8 of 11

Vegetation composition: typical vascular plants	Percentage cover at a representative number of 2m x 2m monitoring stops	Maintain adequate cover of typical vascular plant species	For lists of typical plant species see the Article 17 conservation status assessment for alkaline fens (NPWS, 2013) and the fen habitats supporting document (Kimberley, 2013). See also Perrin et al. (2014) and JNCC (2004). In this SAC, the alkaline fen is species-rich with typical vascular plants recorded including black bog-rush (<i>Schoenus</i> <i>nigricans</i>), long-stalked yellow-sedge (<i>Carex</i> <i>lepidocarpa</i>), carnation sedge (<i>C. panicea</i>), common sedge (<i>C. nigra</i>), purple moor-grass (<i>Molinia</i> <i>caerulea</i>), few-flowered spike-rush (<i>Eleocharis</i> <i>quinqueflora</i>), devil's-bit scabious (<i>Succisa</i> <i>pratensis</i>), water mint (<i>Mentha aquatica</i>), grass-of- parnassus (<i>Parnassia palustris</i>), marsh pennywort (<i>Hydrocotyle vulgaris</i>), bog pimpernel (<i>Anagallis</i> <i>tenella</i>), common butterwort (<i>Pinguicula vulgaris</i>) and marsh helleborine (<i>Epipactis palustris</i>) (NPWS, 2005; NPWS internal files)
Vegetation composition: native negative indicator species	Percentage cover at a representative number of 2m x 2m monitoring stops	Cover of native negative indicator species at insignificant levels	Negative indicators include species not characteristic of the habitat and species indicative of undesirable activities such as overgrazing, undergrazing, nutrient enrichment, agricultural improvement or impacts on hydrology. Native negative indicators may include graminoids such as reed canary-grass (<i>Phalaris</i> <i>arundinacea</i>) and reed sweet-grass (<i>Glyceria</i> <i>maxima</i>), tall herbs such as great willowherb (<i>Epilobium hirsutum</i>), bracken (<i>Pteridium</i> <i>aquilinum</i>), bramble (<i>Rubus fruticosus</i>) and common nettle (<i>Urtica dioica</i>), and bryophytes such as <i>Brachythecium rutabulum</i> and <i>Kindbergia</i> <i>praelonga</i>
Vegetation composition: non- native species	Percentage cover at, and in local vicinity of, a representative number of 2m x 2m monitoring stops	Cover of non-native species less than 1%	Attribute and target based on Perrin et al. (2014). Non-native species can be invasive and have deleterious effects on native vegetation. A low target is set as non-native species can spread rapidly and are most easily dealt with when still at lower abundances
Vegetation composition: native trees and shrubs	Percentage cover in local vicinity of a representative number of monitoring stops	Cover of scattered native trees and shrubs less than 10%	Attribute and target based on Perrin et al. (2014). Scrub and trees will tend to invade if fen conditions become drier
Vegetation composition: soft rush and common reed cover	Percentage cover in local vicinity of a representative number of monitoring stops	Total cover of soft rush (<i>Juncus effusus</i>) and common reed (<i>Phragmites</i> <i>australis</i>) less than 10%	Attribute and target based on Perrin et al. (2014)
Vegetation structure: litter	Percentage cover in local vicinity of a representative number of monitoring stops	Total cover of litter not more than 25%	Attribute and target based on JNCC (2004). More than 25% litter cover may indicate insufficient removal of biomass by grazing and/or undesirable water table levels
Physical structure: disturbed bare ground	Percentage cover at, and in local vicinity of, a representative number of 2m x 2m monitoring stops	Cover of disturbed bare ground not more than 10%	Attribute and target based on Perrin et al. (2014). While grazing may be appropriate in this habitat, excessive areas of disturbed bare ground may develop due to unsuitable grazing regimes. Disturbance can include hoof marks, wallows, human footprints, vehicle and machinery tracks. Excessive disturbance can result in loss of characteristic species and presage erosion for peatlands
Physical structure: tufa formations	Percentage cover in local vicinity of a representative number of monitoring stops	Disturbed proportion of vegetation cover where tufa is present is less than 1%	Attribute and target based on Perrin et al. (2014)

Indicators of local distinctiveness	Occurrence and population size	No decline in distribution or population sizes of rare, threatened or scarce species associated with the habitat; maintain features of local distinctiveness, subject to natural processes	This includes species on the Flora (Protection) Order, 2015 and/or Red Lists (Byrne et al., 2009; Regan et al., 2010; Lockhart et al., 2012; Wyse Jackson et al., 2016, etc.). Springs are a notable feature associated with the habitat in the SAC (NPWS, 2005). Red Listed molluscs recorded from fen habitat in the SAC include the Vulnerable species <i>Leiostyla anglica, Vallonia pulchella, Vertigo</i> <i>antivertigo, V. geyeri</i> (listed on Annex II) and <i>Acicula fusca</i> , and Near Threatened species recorded include <i>Vertigo substriata</i> and <i>V. pygmaea</i> (Byrne et al., 2009; Moorkens, 1998; Moorkens and Killeen, 2011). The Endangered <i>Vertigo moulinsiana</i> (listed on Annex II) has also been recorded in the SAC (Byrne et al., 2009; Moorkens and Killeen, 2011). See the conservation objective for Geyer's whorl snail (<i>Vertigo geyeri</i> , species code 1013) in
			whorl snail (<i>Vertigo geyeri</i> , species code 1013) in this volume

Conservation Objectives for : Fin Lough (Offaly) SAC [000576]

1013 Geyer's Whorl Snail *Vertigo geyeri*

To maintain the favourable conservation condition of Geyer's Whorl Snail in Fin Lough (Offaly) SAC, which is defined by the following list of attributes and targets:

Attribute	Measure	Target	Notes
Distribution	Number of occupied 1km squares	No decline, subject to natural processes. There is one known site for this species in the SAC within N0329. See map 2	All the records of Geyer's whorl snail (<i>Vertigo geyeri</i>) in Fin Lough (Offaly) SAC come a single 1km square N0329. See Moorkens (1998) and details of surveyed site VgCAM18 in Moorkens and Killeen (2011) and in Long and Brophy (in prep.)
Occurrence in suitable habitat	Presence in a representative number of samples	No decline, subject to natural processes	Snails should be present in a representative number of samples taken from locations that have suitable habitat following the methodology in Moorkens and Killeen (2011) and Long and Brophy (in prep.)
Habitat area	Hectares	Area of suitable habitat stable or increasing, subject to natural processes; no less than 0.7ha of at least suboptimal habitat	The occupied Geyer's whorl snail (<i>Vertigo geyeri</i>) habitat is found on the north-eastern edge of Fin Lough (Offaly) SAC in the surveyed site VgCAM18. Occupied habitat is defined in Moorkens and Killeen (2011) and Long and Brophy (in prep.). The target for the site (VgCAM18) set by Moorkens and Killeen (2011) is at least 0.7ha of suitable habitat in at least suboptimal condition. In 2016, there was 1.8ha of suitable habitat (Long and Brophy, in prep.)
Habitat quality: vegetation structure and height	Assessment in a representative number of samples	No decline, subject to natural processes	Optimal and suboptimal habitat for Geyer's whorl snail (<i>Vertigo geyeri</i>) at the surveyed site (code VgCAM18) is defined by Moorkens and Killeen (2011) and is given in Long and Brophy (in prep.). The quality of the habitat should be assessed following the methodology and definitions in Moorkens and Killeen (2011) and Long and Brophy (in prep.)
Habitat quality: soil wetness	Percentage of a representative number of sample points	No decline, subject to natural processes; at least 50% of a representative number of sample points in areas of optimal habitat should be classified as optimal wetness; at least 25% in areas of suboptimal habitat	This attribute should be assessed following the methodology and definitions in Moorkens and Killeen (2011) and Long and Brophy (in prep.). Over the site has a whole, soil wetness should be suitable for the species in 50% of sample points within optimal habitat and in 25% of sample points in suboptimal habitat

Map to be read in conjunction with the NPWS Conservation Objectives Document.
