Other Site Characteristics

This, for the most part, is an upland site. The south-western boundary is the HWM along the coast. Heath, in mosaic with rock, bare soil and Pteridium aquilinum, is the dominant habitat. Flushes and bog type vegetation occur in the wetter areas. Small upland lakes and streams are present.

4.2 Quality and importance

The main interest in this site lies in the occurrence of alpine heath of the Arctostaphylos-Juniperus type, a habitat now rare in western Ireland. Though it has suffered some disturbance, it is still of generally good quality. The dry heath component of the site has been greatly damaged by over-grazing and is now of only moderate interest.
