Other Site Characteristics

The site covers a 10 km stretch of coast running southwards from Ballyheigue to Fenit, Co. Kerry. A good diversity of coastal habitats occur, including rocky shore, shingle and sandy beaches, sand dunes, salt marshes, intertidal sand and mud flats, dry heath and dry grassland, wet grassland and reed beds. Akeragh Lough, formerly a brackish lagoon, has silted up since the 1970s and is now mostly wet grassland and swamp vegetation. The underlying geology is limestone and as a result the sandy soil is calcareous in nature and has a high shell fragment content. Recreation and grazing (cattle and rabbits) are the primary landuses.

4.2 Quality and importance

The site is of importance mainly for the diversity of sand dune and salt marsh habitats. Of particular note are the fixed dunes which are substantial in area and of good quality in the southern part of site. There is an interesting transition through a series of dune communities, including humid dune slacks, to salt marsh communities at Carrahane Strand. The site supports important concentrations of wintering waterfowl, including *Pluvialis apricaria* and *Limosa lapponica*, both listed on Annex I of the EU Birds Directive. The sand flats, salt marsh and dunes support important invertebrate communities including nationally threatened species.

4.3 Threats, pressures and activities with impacts on the site
