- **Data quality:** G = 'Good' (e.g. based on surveys); M = 'Moderate' (e.g. based on partial data with some extrapolation); P = 'Poor' (e.g. rough estimation)

### 3.2 Species referred to in Article 4 of Directive 2009/147/EC and listed in Annex II of Directive 92/43/EEC and site evaluation for them

- **Type:** p = permanent, r = reproducing, c = concentration, w = wintering (for plant and non-migratory species use permanent)
- **Unit:** i = individuals, p = pairs or other units according to the Standard list of population units and codes in accordance with Article 12 and 17 reporting (see [reference portal](#))
- **Abundance categories (Cat.):** C = common, R = rare, V = very rare, P = present - to fill if data are deficient (DD) or in addition to population size information

- **Data quality:** G = 'Good' (e.g. based on surveys); M = 'Moderate' (e.g. based on partial data with some extrapolation); P = 'Poor' (e.g. rough estimation); VP = 'Very poor' (use this category only, if not even a rough estimation of the population size can be made, in this case the fields for population size can remain empty, but the field "Abundance categories" has to be filled in)

#### Other Site Characteristics

A large mountain complex comprised of blanket bog, wet and dry heath, humid and dry calcareous grassland, flushes, streams, small lakes, wooded ravines, limestone gorges, limestone scree and steep limestone cliffs which have developed on the sides and summit of an undulating plateau of carboniferous limestone overlain by shale. Post-glacial slippage of sections of cliff has formed an interesting geomorphological feature at the northern end of the site. Numerous swallow holes are found on the plateau. The site includes several megalithic monuments and tombs of archaeological interest.

#### 4.2 Quality and importance

The north-facing limestone cliffs of Arroo Mountain and the 'slips' below them are very important for the rich arctic-alpine vascular plant and bryophyte floras they support. A number of very rare species are found springs and flushes, some of which have tufa formations, occur amongst the calcareous rocky habitats. The main interest of the summit vegetation lies with the extensive area of good quality, almost intact wet heath found there; here also are found several good, but small, examples of intact mountain blanket bog. Falco peregrinus nest on the cliffs, while Pluvialis apricaria on blanket bog in the north-eastern section of the plateau.
